

AI Contribution Statement

Project: FlowPilot AI

This project was conceived, designed, and implemented by me. I selected the project idea, technology stack, application flow, and was responsible for building, integrating, testing, debugging, and deploying the final application. Throughout development, I used ChatGPT as a learning and development assistant rather than as a replacement for my own work. I regularly asked questions about React, reusable component architecture, responsive layouts, semantic HTML, accessibility, SEO, Git, GitHub, deployment, and performance optimization. I also sought guidance whenever I encountered implementation or debugging challenges.

How AI was used

- Discussed project architecture and component organization.
- Explained React implementation approaches and best practices.
- Suggested accessibility and SEO improvements.
- Reviewed semantic HTML and Lighthouse recommendations.
- Helped troubleshoot Git, GitHub, and Vercel deployment issues.
- Helped prepare project documentation and submission materials.

Developer contribution

Every AI suggestion was reviewed before implementation. I integrated the code, customized it to fit my project, tested every change, fixed issues, and made all final technical and design decisions. The final application, its structure, styling, functionality, debugging, deployment, and validation were completed under my responsibility.

Acknowledgement

I would like to acknowledge ChatGPT for serving as a technical mentor throughout this project. It helped me understand concepts, evaluate implementation options, troubleshoot issues, and improve the quality of the application. The project reflects a collaborative learning process, where AI accelerated development while I retained ownership of the implementation and final decisions.
